

# MTH 312 HW 6

Brandyn Tucknott

25 February 2025

**7.4.3.** Decide which of the following conjectures is true, and supply a short proof. For those that are not, give a counter example.

- (a) If  $|f|$  is integrable on  $[a, b]$ , then  $f$  is also integrable on this set.

*Proof.* Suppose  $f : [0, 1] \rightarrow \mathbb{R}$  is defined as

$$f(x) = \begin{cases} 1, & x \in \mathbb{Q} \\ -1, & x \notin \mathbb{Q} \end{cases}$$

Then  $|f| = 1$  on  $[0, 1]$ , so  $|f|$  is integrable on  $[0, 1]$ . However, by theorem 7.4.2,  $g(x) = \frac{1}{2}(f(x) + 1)$  should be integrable on  $[0, 1]$ . But  $g$  is Dirichlet's function, which we know to be un-integrable from  $[0, 1]$ . Since in this instance, the integrability of  $|f|$  and  $f$  are different, we conclude this statement is false.  $\square$

- (b) Assume  $g$  is integrable and  $g(x) \geq 0$  on  $[a, b]$ . If  $g(x) > 0$  for an infinite number of points  $x \in [a, b]$ , then  $\int_a^b g > 0$ .

*Proof.* Consider  $g : [0, 1] \rightarrow [0, 1]$  defined as

$$g(x) = \begin{cases} 1, & x = \frac{1}{n}, n \in \mathbb{N} \\ 0, & \text{otherwise} \end{cases}$$

In HW 5 we computed  $\int_0^1 g = 0$ . There are clearly an infinite number of points of the form  $\frac{1}{n} > 0 \in [0, 1]$ , but  $\int_0^1 g = 0$ . We conclude this statement is false.  $\square$

- (c) If  $g$  is continuous on  $[a, b]$  and  $g(x) \geq 0$  with  $g(y_0) > 0$  for at least one point  $y_0 \in [a, b]$ , then  $\int_a^b g > 0$ .

*Proof.* If there exists  $y_0$  s.t.  $g(y_0) > 0$ , then there exists  $\delta > 0$  s.t. if we define  $I = [a, b] \cap [y_0 - \delta, y_0 + \delta]$ , then  $x \in I \rightarrow g(x) > 0$ . In particular, for  $\epsilon = \frac{g(y_0)}{2} > 0$ ,

$$g(x) \in [g(y_0) - \epsilon, g(y_0) + \epsilon] \rightarrow g(x) > g(y_0) - \epsilon = \frac{g(y_0)}{2} = \epsilon > 0$$

Let  $c = \inf I, d = \sup I$ . By theorem 7.4.1,

$$\int_a^b g = \int_a^c g + \int_c^d g + \int_d^b g$$

Since  $g \geq 0$ , by theorem 7.4.2 we have that  $\int_a^c g, \int_d^b g \geq 0$ , and also  $\int_c^d g \geq \epsilon(d - c) > 0$

We conclude this statement is true.  $\square$

**7.4.8.** For each  $n \in \mathbb{N}$ , let

$$h_n(x) = \begin{cases} \frac{1}{2^n}, & \text{if } \frac{1}{2^n} < x \leq 1 \\ 0, & \text{if } 0 \leq x \leq \frac{1}{2^n} \end{cases}$$

Set  $H(x) = \sum_{n=1}^{\infty} h_n(x)$ . Show  $H$  is integrable and compute  $\int_0^1 H$ .

*Proof.* Let  $N \in \mathbb{N}$ , let  $H_N : [0, 1] \rightarrow \mathbb{R}$  be the  $N^{th}$  partial sum of  $H$ . Then

$$H_N(x) = \begin{cases} 0, & \text{if } x \in [0, \frac{1}{2^N}] \\ \frac{2^k - 1}{2^N}, & \text{if } x \in (\frac{1}{2^{N-k+1}}, \frac{1}{2^{N-k}}] \end{cases}$$

for  $k \in [1, N]$ . Observe that each  $H_N$  is piecewise constant, thus by theorem 7.4.1 it is integrable. To explicitly compute the integral on  $[0, 1]$ ,

$$\begin{aligned} \int_0^1 H_N &= \sum_{k=1}^N \int_{2^{-(N-k+1)}}^{2^{N-k}} H_N \\ &= \sum_{k=1}^N \left( \frac{2^k - 1}{2^N} \right) \left( \frac{1}{2^{N-k}} - \frac{1}{2^{N-k+1}} \right) \\ &= \frac{2}{3} - \frac{1}{6 \cdot 4^{N-1}} - \frac{1}{4^N} + \frac{1}{2^{N+1}} \end{aligned}$$

Thus

$$\int_0^1 H_N = \lim_{N \rightarrow \infty} \int_0^1 H_N = \frac{2}{3}$$

□

**7.5.2.** Decide whether each statement is true or false, providing a short justification for each conclusion.

- (a) If  $g = h'$  for some  $h$  on  $[a, b]$  then  $g$  is continuous on  $[a, b]$ .

Solution.

This statement is false, and is apparent when we consider the function

$$h(x) = \begin{cases} \sin\left(\frac{1}{x}\right), & x \neq 0 \\ 0, & x = 0 \end{cases}$$

Here,  $h$  is differentiable, but  $h'$  is not continuous.

- (b) If  $g$  is continuous on  $[a, b]$ , then  $g = h'$  for some  $h$  on  $[a, b]$ .

Solution.

Since  $g$  is continuous on  $[a, b]$ ,  $g$  is integrable on  $[a, b]$ , so we define  $h(x) = \int_a^x g$ , and by the Fundamental Theorem of Calculus, we have that  $h' = g$ . We conclude this statement is true.

- (c) If  $H(x) = \int_a^x h$  is differentiable at  $c \in [a, b]$ , then  $h$  is continuous at  $c$ .

Solution.

If we consider

$$h(x) = \begin{cases} 0, & x \neq 0 \\ 1, & x = 0 \end{cases}$$

Then  $\int_a^x h = 0$ , everywhere and thus differentiable, but  $h$  is not continuous at  $c = 0$ . We conclude this statement is false.
